

Site Audit: Issues

webchamp.services

- Overall, the website is performing well in many technical areas, showing no issues for common problems like broken links, duplicate content, or slow page loading.
- However, there are a few critical issues that require immediate attention to ensure the website functions correctly and is easily found by search engines.
- One page on the website is currently inaccessible due to a server error, preventing both visitors and search engines from reaching it.
- The file that guides search engines on how to explore the website has formatting problems, which could affect how well the site appears in search results or even expose private content.
- One piece of special code designed to help search engines understand page content is not set up correctly, which might prevent the website from getting better visibility in search results.
- Additionally, there are some areas identified as warnings that, while not critical, should be addressed to improve the website's overall performance and search engine ranking.
- One page is missing its main heading, which is important for both users and search engines to understand the page's topic.
- Another page has a low amount of visible text compared to its underlying code, which can impact how quickly the page loads and how search engines perceive its content quality.
- One page contains very little written content. Search engines generally prefer pages with more comprehensive information to provide better value to users.
- Two parts of the website that handle secure connections are not fully supporting a security standard, which means some content might not be delivered as securely as possible.
- This report provides a snapshot of current activity. Deeper trend analysis will become more reliable with a longer data history, especially given that only 5 pages were crawled for this audit.

Site Audit: Issues

Subdomain: webchamp.services

Last Update: December 13, 2025

Crawled Pages: 5

webchamp.services

ERRORS

3 0

1 page returned a 5XX status code

1 0

About this issue: 5xx errors refer to problems with a server being unable to perform the request from a user or a crawler. They prevent users and search engine robots from accessing your webpages, and can negatively affect user experience and search engines' crawlability. This will in turn lead to a drop in traffic driven to your website.

How to fix: Investigate the causes of these errors and fix them.

Robots.txt file has format errors

1 0

About this issue: If your robots.txt file is poorly configured, it can cause you a lot of problems. Webpages that you want to be promoted in search results may not be indexed by search engines, while some of your private content may be exposed to users. So, one configuration mistake can damage your search rankings, ruining all your search engine optimization efforts.

How to fix: Review your robots.txt file and fix all errors, if there are any. You can check your file using Google's robots.txt Tester: <https://www.google.com/webmasters/tools/robots-testing-tool>. For information on how to configure your robots.txt, please see this article: https://developers.google.com/webmasters/control-crawl-index/docs/robots_txt.

1 structured data item is invalid

10

About this issue: This issue is triggered if structured data items contain fields that do not meet Google's guidelines <https://developers.google.com/search/docs/data-types/article>. Implementing and maintaining your structured data correctly is important if you want to get an edge over your competitors in search results. If your website markup has errors, crawlers will not be able to properly understand it, and you may run the risk of losing the chance of gaining rich snippets and getting more favorable rankings.

For more information on the structured data requirements, see <https://schema.org>, Google documentation <https://developers.google.com/search/docs/data-types/article> or our article <https://www.semrush.com/kb/1084-structured-data-items-site-audit>. How to fix: Check structured data on your webpages with a validation tool. Please note that different markup testing tools may show different results.

We recommend that you use the Rich Results Test tool <https://search.google.com/test/rich-results> to review and validate your pages' structured data against their rich snippet requirements.

WARNINGS

3 0

1 page doesn't have an h1 heading

1 0

About this issue: While less important than <title> tags, h1 headings still help define your page's topic for search engines and users. If an <h1> tag is empty or missing, search engines may place your page lower than they would otherwise. Besides, a lack of an <h1> tag breaks your page's heading hierarchy, which is not SEO friendly.

How to fix: Provide a concise, relevant h1 heading for each of your page.

1 page has low text-HTML ratio

1 0

About this issue: Your text to HTML ratio indicates the amount of actual text you have on your webpage compared to the amount of code. This issue is triggered when your text to HTML is 10% or less. Search engines have begun focusing on pages that contain more content.

That's why a higher text to HTML ratio means your page has a better chance of getting a good position in search results. Less code increases your page's load speed and also helps your rankings. It also helps search engine robots crawl your website faster.

How to fix: Split your webpage's text content and code into separate files and compare their size. If the size of your code file exceeds the size of the text file, review your page's HTML code and consider optimizing its structure and removing embedded scripts and styles.

1 page has a low word count

1 0

About this issue: This issue is triggered if the number of words on your webpage is less than 200. The amount of text placed on your webpage is a quality signal to search engines.

Search engines prefer to provide as much information to users as possible, so pages with longer content tend to be placed higher in search results, as opposed to those with lower word counts.

For more information, please view this video: <https://www.youtube.com/watch?v=w3-obcXkyA4>. How to fix: Improve your on-page content and be sure to include more than 200 meaningful words.

NOTICES

3 0

2 subdomains don't support HSTS

About this issue: HTTP Strict Transport Security (HSTS) informs web browsers that they can communicate with servers only through HTTPS connections. So, to ensure that you don't serve unsecured content to your audience, we recommend that you implement HSTS support. How to fix: Use a server that supports HSTS.

2 0

lms.txt has formatting issues

About this issue: If your lms.txt file is incorrectly formatted, AI search engines that use it may interpret your website's content less accurately. How to fix: Review your lms.txt file and fix all issues. Visit lms.txt.org to find out how to properly format your file.
